

MAAP #63: Patterns of Deforestation in the Colombian Amazon

July 2, 2017

We are excited to present our initial analysis of the **Colombian Amazon**, a work that reflects an important collaboration with our colleagues at Amazon Conservation Team (<http://www.amazonteam.org/>). It is also our first report in the more interactive “**Story Map**” format.

This report has **two objectives**: 1) Illustrate the major deforestation hotspots in the Colombian Amazon between 2001 and 2015 and 2) Focus in on one of the most important hotspots, located in the Caquetá department. In short, we show satellite imagery of the expanding forest loss in one of the most important deforestation hotspots in the Colombian Amazon.
