

MAAP #77: Deforestation Hotspots in the Colombian Amazon, part 2

January 29, 2018

We present the second in a series of story maps investigating **deforestation hotspots** in the **Colombian Amazon**. Our goal is to identify the most critical hotspots (areas with the highest densities of deforestation) and use satellite imagery to identify the primary deforestation drivers.

The **first report** (<https://www.maaprogram.org-deforestation-patterns-colombian-amazon/>) focused on a hotspot approaching Chiribiquete National Park in Caquetá department, and the deforestation was largely driven by cattle pasture.

Here (<https://www.maaprogram.org/colombia2/>), we move to the south and focus on a hotspot surrounding **La Paya National Park** in Putumayo Department. We show high-resolution satellite imagery that reveals the major driver is again cattle pasture.

Please follow this link to view the Story Map: **Deforestation Hotspots in the Colombian Amazon, part 2** (<https://www.maaprogram.org/colombia2/>)

This work reflects an important collaboration with our colleagues at Amazon Conservation Team (<http://www.amazonteam.org/>), funded by the MacArthur Foundation.
